

Protect your Students and Save Money

Dear University Fire Safety Professional:

The safety and security of students is one of every college and university's biggest concerns!

And parents expect that proper safeguards will be taken to protect their children.

Every year, on college and university campuses across the U.S., there are tens of thousands of nuisance alarms resulting in building evacuations and fire runs that:

- place the campus community and first responders at risk.
- result in hours of lost productivity for students and staff.
- result in significant costs to the university & fire department.
- create student apathy towards fire alarms ...

"When I hear the alarm go off, I tend to shrug it off because it's almost never real"

- Ohio University sophomore student

The majority of nuisance alarms are caused by burnt food events in microwave ovens.

And they can be prevented!

The **Safe-T-sensor™** is a simple, but revolutionary product that fits on most free standing microwave ovens. Once installed it works by interrupting power to the microwave at the first sign of smoke helping to prevent fires, nuisance alarms, building evacuations and fire runs.

In 2011, Ohio University installed 4,479 **Safe-T-sensors™** (one on every microwave on campus) which resulted in a **92% reduction in burnt food runs and an expected savings of \$222,000 by year three.** These findings were presented at Vision 20/20's Model Performance in Fire Prevention Symposium.

YOU COULD DO THE SAME FOR YOUR SCHOOL!!
